FAMOUS QUOTES GENERATOR

A description of the site that you are planning with enough background context for your reader to understand what you are trying to do

Some days, you need the right inspiration to kick-start your day. In this author's experience, said inspiration often comes in the form of a quote from a famous author or figure.

As a go-to resource for a daily dose of inspiration, and serendipitous wisdom, the present report aims at laying the foundations for a clean, easy-to-use website, whose main purpose is to generate a random quote in an elegant and relaxing setting.

At the heart of the website there will be the **Home page**, containing **basic instructions** and a **simple button** to generate a **random quote**.

The website intends to be pleasing to the eye, relaxing and inspiring, matching the broad purpose of getting wisdom from great figures from the past. One could use it throughout the day, keeping it open in a pinned tab in the browser.

Ideally, classical/jazz music will be playing automatically in the background, using a local mp3/ogg file.

Alternatively, or additionally, a **Spotify mini-player** could be embedded in one of the pages, to tap into Spotify's endless library.

At the top of the website there will be a **navigator element**, which will point to different sections of the site. It will contain:

- **Featured**
- **Home**
- **Categories**
- **Authors**
- **Bonus**
- **About us**

A summary of any background research into other similar sites, or useful technologies, libraries, or APIs that you have investigated with a description of how this has contributed to your project idea and design

The main source of inspiration for the chosen topic of the project is the classic http://www.textfiles.com/ website, whose http://www.textfiles.com/etext/AUTHORS/ section has been particularly admired by this author over the years. The ambition for the current project is to try and replicate, albeit in much reduced form, the same sense of unexpected depth in the shallows of the internet.

Another source of inspiration has been the website https://randomquotations.com.

At the heart of the current project is the open-source **Api Quotable**: (https://github.com/lukePeavey/quotable).

Great care has been taken to make sure that said API includes **specific endpoints** to retrieve authors and categories, which are fundamental building blocks of the website.

The GitHub link above contains the full backend project, and also showcases a few frontend implementations, which have been of some inspiration for the current project.

As part of the **Bonus** section, two different APIs have been investigated:

- A **dad jokes generator**: https://icanhazdadjoke.com/api
- A **movies/TV shows** quote generator: https://rapidapi.com/rur209-fl23Nrvhxii/api/movie-and-tv-shows-quotes/

Part of the investigation consisted in a simple **POC** (Proof Of Concept) website, to test the functionality of all the APIs aforementioned.

As previously discussed, an additional feature could be a self-contained **Spotify mini-player**. This functionality, essentially a **ready-to-use snippet** of HTML code provided by Spotify, has also been tested in the POC, and confirmed to be working as intended.

A list of features and some discussion of why each feature is included

Homepage

The landing page of the website—its *index.html* file—will be characterised by an appropriately **pleasing theme colour and background**. These will be maintained throughout the pages to ensure consistency, readability, accessibility and a well-polished experience.

The title at the centre of the page will read: *"Famous quotes generator".* A subtitle underneath will specify: *"Press the button to get started".* A button further down will read: *"Generate quote".*

When available, the element at the centre hosting the quote will feature the quote's author's picture.

This simple layout will ensure an intuitive understanding of how the page works.

Featured

This section will be essentially an **Editor's Pick** section. The maintainer of the website can choose to feature a quote or a set of quotes based on recurring celebrations (Christmas, Easter, Valentine's Day…) or current events. This should **add some variety** to an otherwise very static experience.

Categories

This page of the website will allow the user to browse quotes by **topic**. Given the vast amount of quotes available, this feature will increase the versatility of the website over time. Two different implementations will be considered:

- A simple one, with all **categories listed** alphabetically, and possibly paginated
- A more elaborate one, with a **search bar** that allows free user input

A third and final possibility could be a composite of the two options above.

Authors

Similarly to the Categories page, the Authors page allows browsing the quotes by author. The same considerations will apply: In the implementation phase, a choice

will be made on whether to have a simple, possibly paginated, **author's list**; a **free-search box**; or both.

Bonus

To escape the monotony of the umpteenth quote of the day, the Bonus section will provide some fun as a relief from the serious mood of the other pages.

The two bonus feature intended at the time of writing are:

- A dad joke generator
- A movies/TV shows quote generator

About Us

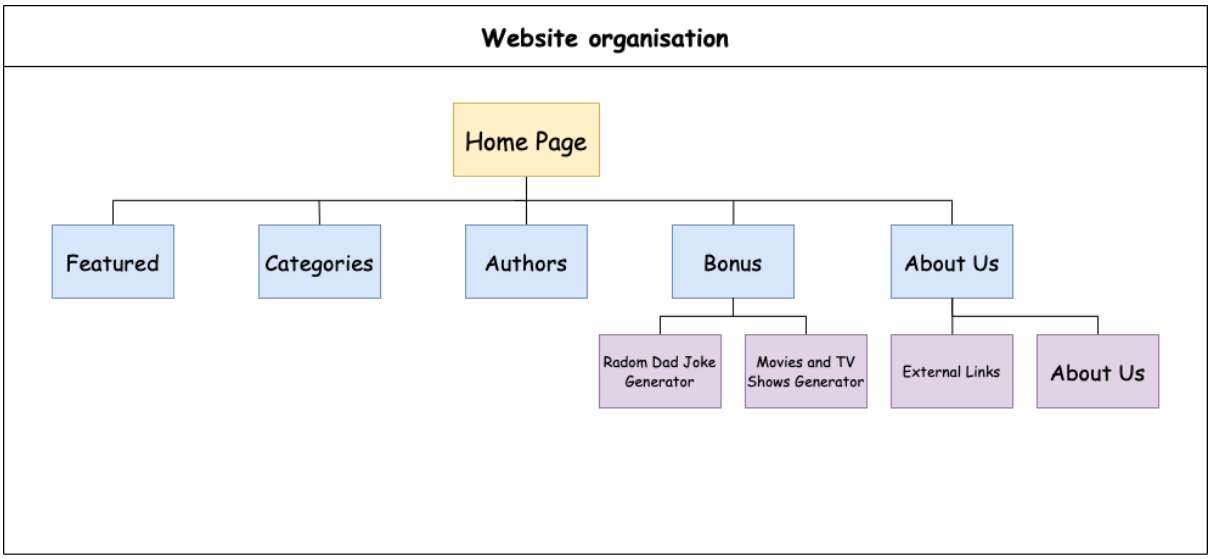
This final section (last in the navigation bar) intends to provide some useful information on the creators of the website, ways to contact them (for example to suggest improvements or to provide generic feedback) and a link to the **GitHub page** that hosts the website, where it will be possible, besides browsing the source code for the project, to raise bugs or other problems directly into the **Issues tab**.

A mention on usability

The website's target audience should be as broad as possible, so particular emphasis will be put on usability. The final result must be easy to use, with **minimal clicks** required to get through it. There will be clear ways to move back and forward, and text and background will have an **appropriate level of contrast**. For this purpose, specific accessibility analyzer tools will be used in the development phase (for example: https://www.accessibilitychecker.org/).

It's also important that the website be accessible on **small screens**—in particular phones and tablets. For this reason additional options will be added to the CSS files to specify how to draw the content, e.g. the navigation bar, when the horizontal resolution falls under a certain threshold.

Site organisation and/or navigation tree diagrams with associated discussion and explanation of how you plan to organise the pages that make up your site and how a user might typically navigate through those pages



One first load of the website, the first page will naturally be the Home Page. This will be the second item from the left in the navigation bar. For improved accessibility, a homepage icon could also be featured, which will redirect to the same place. As already discussed, the Home Page features an easy interface for generating a random quote. The idea is to reduce to a minimum the effort—in this case, to a single click. It will be considered during the development phase whether or not to load a random quote at page load, reducing further the effort to zero. However, presently the required click seems the most reasonable approach.

The link to the featured page will be the first on the left in the navigation bar (from now on called navbar), as this instinctively conveys more the idea of a dynamic content, as opposed to the staticity of the items to the right of the Home Page in the navbar.

It's possible that during the development only the Home Page icon will be kept, and the link to Home removed from the navbar. This decision will be postponed to the development phase, when it will be easier to get a sense of the general look.

The Bonus section won't host content by itself, but will offer the choice of two or more additional pages, hosting the actual bonus content.

At the end of the navbar, the About us will host itself some content (bio/history of the website) but will also provide links to contact the authors and maintainers of the

website. It's possible that during development this subsection will be merged into the above About Us page.

A sketch prototype of an initial user interface for your site and some commentary on the motivation for your design

The navbar is a convenient and well-known approach to designing websites, so will be the natural choice for the project. A horizontal orientation has been chosen, to allow as much space as possible around the content. As the pages want to be inspirational and relaxing, it is important not to create a sense of "clutter", but to allow for as much space as possible between the elements. This will also make carefully-chosen background picture easy to see and appreciate.

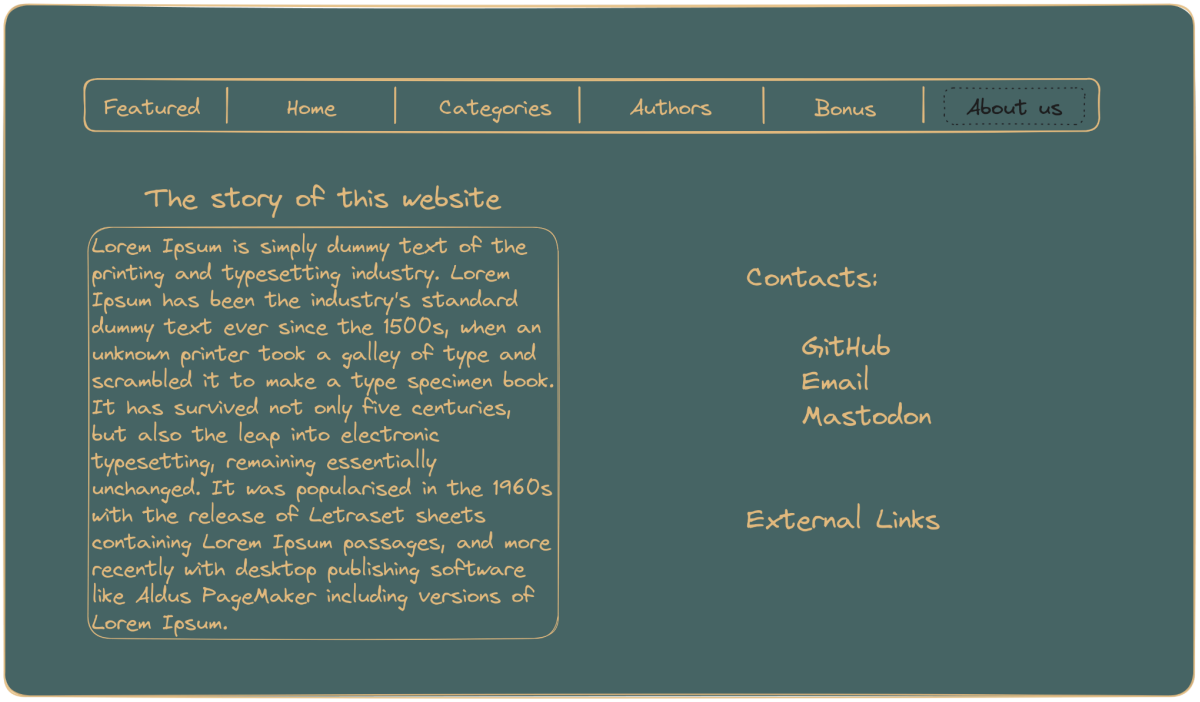
Random Dad Joke Generator

Random Movies and TV Shows quote generator



A project plan that demonstrates how you will organise your effort and time to achieve your goals

As the project will be executed by a single individual, the formality of a Gantt chart will be discarded in favour of a more Agile and iterative approach. Nonetheless, it is possible to delineate in broad strokes a timeline.

The **first phase** of development will gravitate around a well-crafted **backbone** of the website — i.e. the HTML content. This phase will ensure that all the fundamental elements are present, that is all the pages planned for the website.

A **second phase** will be centred around the **look and feel** of the pages, with particular interest around the **CSS** files of the project. Transition and hover effects will be evaluated at this point. It is also here that the websites will be "*hooked up"* to the APIs with **JavaScript**, and the quotes will spring to life.

A **third and final phase** will be the most iterative, where the pages and the general experience will be **polished and refined**. In this phase it will be important to consider eventual APIs limits. To avoid downtime, if such limits for the APIs used are in place, placeholders will be added to the quotes sections. This is also where the website will be tested with different browsers, simulating also different devices, like an iPhone or iPad, with the browser's developer tools.

The table below recaps the main points:

Phase	Scope	Timeline
1 - Build the backbone	HTML code, user's journey	4th - 18th March
2 - Style and JS functionality	CSS styling, APIs working	18th March - 8th April
3 - Polish	Stress testing, edge cases, accessibility, final touches and last minute changes	8th - 26th April

Conclusion

In summary, this report outlines the plan for creating a website focused on providing daily inspiration through famous quotes. With careful consideration for user experience, and leveraging simple web technologies and APIs, the project aims to deliver a visually appealing and easy-to-use platform for users seeking motivational content.

It's important to note that plans may evolve or adjust as the project advances. Flexibility will be maintained to accommodate any necessary changes and ensure a satisfactory completion of the website.
